## 1. Battery in and E-stop switch (LM5069-1, two FETs)

The bank is the soft start for all the motor capacitance; BMS sees no inrush. Reset closes it; loop open drops it. No software in the path. Compute is not behind it.
R5 0.5 mOhm; limit 97–123 A (VCL 48.5–61.5 mV), breaker 160–260 A (VCB 80–130 mV). Above peak draw and JK DOC 80 A, 1.6 W at 60 A.
Start: Cdv 100 nF, gate 10–22 uA, 100–220 V/s, 0.25–0.55 s to full. Bus ceiling 9.4 mF at 2.06 A hot DC SOA line (112 W, 45 K Tj rise). Drive caps unmeasured.
Power limit 544 W, 87W5 = 125k x Rs + P. 5 mV floor per SNVS452C sec 9.2.1.2.3. Timer 22 nF: 1.0 ms typ, 1.8 ms max.
Fault check: 675 W (+24 %) is 52.4 A at 54.6 V against about 15 A at 1.8 ms; 70 C one FET, scaled from the 10 ms curve as sqrt(t). Read the real curve at layout.
Q3 pulls GATE down on UVLO, OVLO, or a CDV_B fault; Q2 then gets the gate and turns off.
Body diodes pass regen back to the pack with the bank open. OVLO tied low: opening on overvoltage would strand regen on the bus.
LM5069-1 latches on a fault. Clear: E-stop cycle, then reset.
SMDJ58A: catches the battery lead's inductive kick when the bank opens. Clears 54.6 V, FETs and U1 are 100 V.

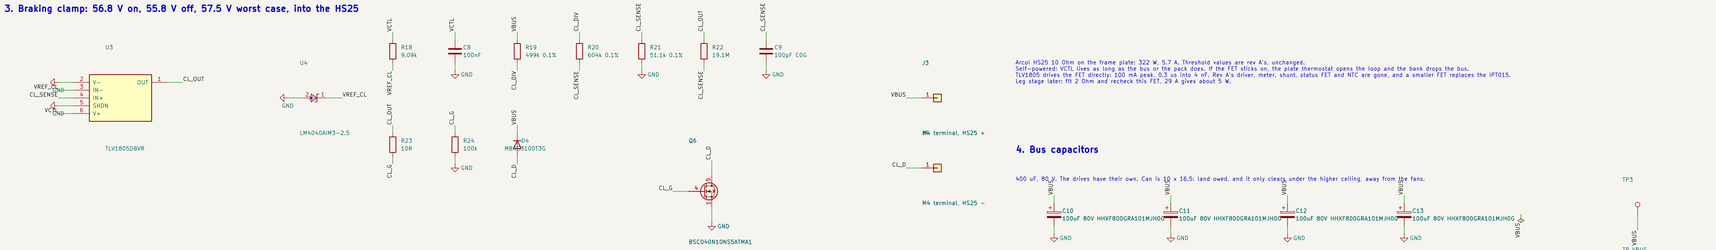

## 2. Control rail and E-stop latch (no logic IC)

12.1 V, 11 mA. On the battery side, so regen through the body diodes keeps it up with the BMS open. Runs the latch and the clamp. 0.5 W at 54.6 V.

Seal-in latch, nopsice checked at hFE 80: stays off at power-up even with reset held, reset closes it, a 50 us contact bounce rides through.
loop open drops it in about 100 us, re-closing the loop does nothing, a reset held through a loop cycle does nothing, a new press works 5 ms after release.
RUN 7 V (UVLO 5.5 V): needs 5.7–6.1 V rising, so it holds. Loses VCTL, RUN drops, UVLO drops, bank opens.
Loop 6 mA, wetting for a control-rated NC contact. No 12 V on the connector without a series R. pin 1 next to GND: a short there opens the loop.
Brake resistor NC thermostat: wire it in series in the loop harness, no board parts. E-stop model still to confirm.

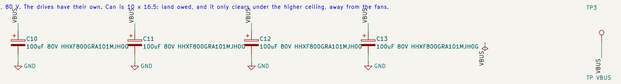

## 3. Braking clamp: 56.8 V on, 55.8 V off, 57.5 V worst case, into the HS25

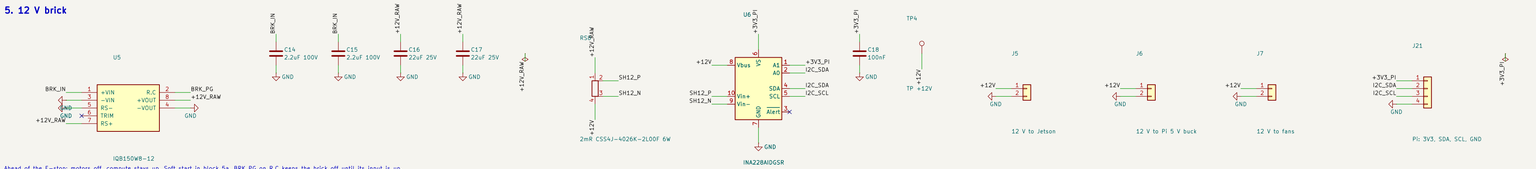

Arcol HS25 10 Ohm on the frame plate; 322 W, 5.7 A. Threshold values are rev A's, unchanged.
Self-powered: VCTL lives as long as the bus or the pack does, if the FET sticks on, the plate thermostat opens the loop and the bank drops the bus.
TLV1805 drives the FET directly: 100 mA peak, 0.3 us into 4 nF. Rev A's driver, meter, shunt, status FET and NTC are gone, and a smaller FET replaces the IPT015.
Leg stage later: fit 2 Ohm and recheck this FET, 29 A gives about 5 W.

## 4. Bus capacitors

400 uF, 80 V. The drives have their own, Can is 160 x 16.5: land owed, and it only clears under the higher ceiling, away from the fans.

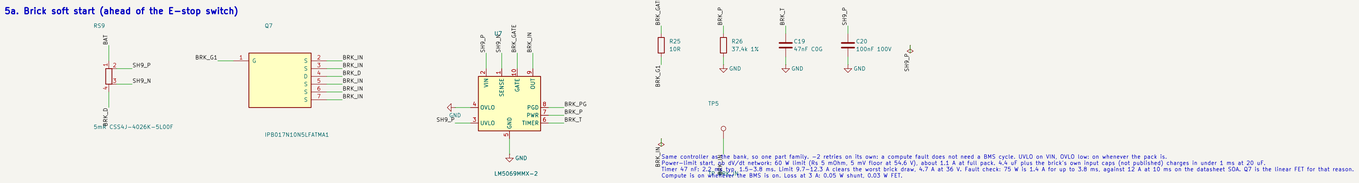

## 5. 12 V brick

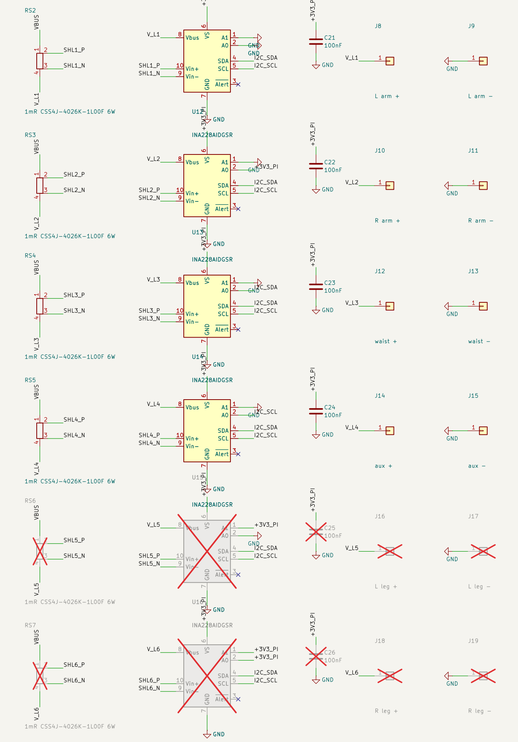

Ahead of the E-stop: motors off, compute stays up. Soft start in block 5a, BRK_PG on R_C keeps the brick off until its input is up.
−Vout is tied to GND here; the robot has one ground. P−, RS+ and RS− tied at the pins, Trim open. Input caps at the pins: the EMC filter is left out.
150 W at 12 V, 89 %; 18 W at full load, about 6 W at 50 W. Natural-air derating starts near 30 C, 12.7 mm tall: keep clear of the fan gap.
INA228 addresses: L arm 0x40, R arm 0x41, waist 0x42, aux 0x43, L leg 0x44, R leg 0x45, 12 V 0x46. Powered by the PI's 3.3 V: PI pull-ups on I2C.

## 5a. Brick soft start (ahead of the E-stop switch)

Same controller as the bank, so one part family. ~2 retries on its own; a compute fault does not need a BMS cycle, UVLO on VIN. OVLO low: on whenever the pack is.
Power-limit start, go dV/dt network: 60 W limit (0x 5 mOhm, 5 mV floor at 54.6 V), about 1.1 A at full pack. 4.4 uF plus the brick's own input caps (not published) charges in under 1 ms at 20 uF.
Timer 47 nF: 2.2 ms typ, 1.5–3.8 ms, limit 9.7–12.3 A clears the worst brick draw. 4.7 A at 36 V. Fault check: 75 W is 1.4 A for up to 3.8 ms, against 12 A at 10 ms on the datasheet SOA. Q7 is the linear FET for that reason.
Compute is on all over the BMS is on. Lose at 3 A: 0.05 W shunt, 0.03 W FET.

## 6. Limb outputs: terminal pair, 1 mOhm shunt, INA228. Fuses inline in the pigtails.

1 mOhm: 60 A peak is 60 mV, ADCRANGE 0, 0.36 W at 19 A.
Legs DNP: fit the same parts when they arrive.

Rev B: a part goes in only if leaving it out would hurt. Parts list: hardware/electrical/pdb/REV_B_PARTS.md
